1. Photosynthesis is the process by which plants make food. Plants use sunlight, oxygen and water to make food. Carbon dioxide is produced in this process.

① Photosynthesis is how plants create their food. Carbon dioxide, water and sunlight is used and oxygen is released.

1) Photosynthesis is the process by which plants make food. Plants use sunlight, oxygen and water to make food. Carbon dioxide is produced in the process.

(1) Photosynthesis is the process by which plants make food. Plants use Oxygen, sunlight & water to make food. Carbon dioxide is produced in the process.

1. Photosynthesis is the process by which plants make food. Plants use oxygen, sunlight & water to make food. Carbon dioxide is produced in the process.

1) Photosynthesis is the process by which plants make food. Plants use oxygen, sunlight and water to make food.

Photosynthesis is the process by which plants make food. Plants use sunlight, oxygen and water to make food. carbon dioxide is produced in this process.

Photosynthesis is the process by which plants make food. Plants use sunlight, oxygen and water to make food. carbon dioxide is produced in this process.

Photosynthesis is the process by which plants make food. Plants use sun light, oxygen and water to make food. Carbon dioxide is produced in this process.

A)

1] Photosynthesis is the process by which plants produce food by using sunlight, carbon dioxide and water. It also produces oxygen as a by-product

1] Photosynthesis is the conversion of CO_2, water & sunlight to produce nutrition for the plant and also releases oxygen. Photosynthesis only occurs where chlorophyll is present.

A Q1)

1) photosynthesis is the process by which chlorophyll converts sunlight carbon dioxide and water to make food and release oxygen as a by product.
